RRL - CHAPTER 2 (AI-Based Diet and Nutritional Planner)

Foreign Literature

1. Armand et al. (2024) found that these technologies can be applied to personalized nutrition, dietary assessment, food recognition, disease prevention, and health monitoring. The findings show that AI can improve nutritional outcomes and provide more personalized dietary recommendations.

2. Fu and Chen (2025) found that artificial intelligence, machine learning, and deep learning can improve drug discovery and development by increasing efficiency, accuracy, and reducing costs. AI can assist in drug design, target identification, virtual screening, and clinical trials. This study is relevant to the present research as it demonstrates the potential of AI to improve processes and decision-making in the pharmaceutical field.

3. Singar et al. (2024) found that personalized nutrition uses genetic information to provide tailored dietary recommendations and improve health outcomes. The study highlighted the role of technology, bioinformatics, and genomics in developing individualized dietary guidelines. This study is relevant to the present research as it supports the potential of technology in providing personalized and effective nutrition recommendations.

4. Kassem et al. (2025) found that artificial intelligence can improve dietary assessment, personalized nutrition, and the management of diet-related diseases. AI technologies such as machine learning, visual recognition, wearable devices, and chatbots can provide more accurate dietary tracking and tailored nutrition solutions. This study is relevant to the present research as it demonstrates the potential of AI in improving nutrition assessment and personalized dietary recommendations.

5. Arshad et al. (2025) found that digital health technologies can support personalized nutrition for managing diabetes and obesity. Tools such as continuous glucose monitors, AI-driven meal planning, and mobile health applications can provide

tailored dietary recommendations and improve disease monitoring. This study is relevant to the present research as it highlights the potential of AI and digital technology in providing personalized nutrition solutions.
